

Inserting Video into PowerPoint

These instructions apply to inserting live video into PowerPoint. [An active Internet connection is required.](#)

Using LiveWeb

LiveWeb is a free add-in for PowerPoint (all versions) that lets you display web pages live in your PowerPoint slides. In fact, LiveWeb is like embedding a full browser in your PowerPoint presentation because you can interact with web pages as if they were opened in a real browser – all the links on web pages stay intact and live.

To obtain and install LiveWeb, PowerPoint 2007 and later users [click here](#) to download; PowerPoint 2003 users [click here](#) to download. Install the PowerPoint Add-In using the instructions in the downloaded zip file. If you need additional help, try googling “liveweb”; there are many sources to assist you.

Inserting your Video

In ArcLearn, go to the course detail page for your selected video. Open the **Videos** tab at the bottom. Select the Full Length Video or Video Clip (see the drop down arrow) depending on your video requirement. Click on **Copy URL**. Note: in IE8, you will need to highlight and copy the URL.

In PowerPoint, click on the [Insert](#) tab. Click on Web Page in the LiveWeb control area to start the LiveWeb wizard. Paste the URL into the LiveWeb window when so prompted. Follow instructions from the wizard.

Use the Slide Show to preview the video.
